---

This work is a product of the Collaborative Research Center 531, "Computational Intelligence", at the University of Dortmund and was printed with financial support of the Deutsche Forschungsgemeinschaft.

The starting point of this paper is the classical well-known theorem due to G. BIRKHOFF, P. HALL, and J. SCHMIDT which establishes a one-to-one correspondence between compact closure operators, inductive closure operators, inductive closure systems, and closure operators generated in universal algebras (and generated in deductive systems, respectively). In the paper presented we make first steps in order to generalize this important theorem to the fuzzy set theory and fuzzy algebra (and fuzzy deductive systems, respectively).

**Keywords** Compact Closure Operators, Inductive Closure Operators, Inductive Closure Systems, Universal Algebras, Deductive Systems, Fuzzification

## 1 Introduction

For arbitrary crisp sets  $A$  and  $B$  by  $A \cap B$ ,  $A \cup B$ , and  $A \setminus B$  we denote the usual intersection, union, and difference of  $A$  and  $B$ , respectively, furthermore  $A \subseteq B$  means that  $A$  is a subset of  $B$ . For an arbitrary system  $\mathfrak{A}$  of sets by  $\bigcap \mathfrak{A}$  and  $\bigcup \mathfrak{A}$  we denote the intersection and the union of all sets of  $\mathfrak{A}$ , respectively. If we have a family  $(A_i | i \in I)$  of sets  $A_i$ , then we write  $\bigcap_{i \in I} A_i$  and  $\bigcup_{i \in I} A_i$ . The cardinal number of  $A$  is denoted by  $\text{card} A$ , the power set of  $A$  by  $\mathbb{P}(A)$ , the empty set by  $\emptyset$ , and the empty sequence of elements of a set by  $e$ . Hence we define  $A^0 =_{\text{def}} \{e\}$ .  $A^n =_{\text{def}}$  the set of all sequences of elements of  $A$  with the length  $n$  where  $n$  is an integer with  $n \geq 1$ . Finally, we define  $A^* =_{\text{def}} \bigcup_{n \in \mathbb{N}} A^n$  where  $\mathbb{N} = \{0, 1, \dots\}$ .

For compact denotation in the following we shall use sometimes the symbolic of predicate calculus, i. e.  $\forall x$  as “for every  $x$ ”,  $\exists x$  as “there is an  $x$ ”,  $\wedge$  as “and”,  $\vee$  as “or”,  $\rightarrow$  as “if - then”,  $\leftrightarrow$  as “if and only if”,  $\neg$  as “not”.

Remember the definition of a complete lattice

$$\mathfrak{L} = [L, \wedge, \vee, 0, u]$$

with the domain  $L$ , the intersection operator  $\wedge$ , the union operator  $\vee$ , the zero element  $0$ , and the unit element  $u$ .

Remember that by the definition

$$x \preceq y =_{\text{def}} x \wedge y = x \quad (x, y \in L)$$

there is introduced a partial order on  $L$ . For  $K \subseteq L$  by  $\inf K$  and  $\sup K$  we denote the infimum and the supremum of  $K$  with respect to  $\preceq$ , respectively. A set  $C \subseteq L$  is said to be a chain of  $\mathfrak{L}$  if and only if

$$\forall x \forall y (x, y \in C \rightarrow x \preceq y \vee y \preceq x) .$$

Let  $\leq$  be the natural ordering of real numbers. For an arbitrary set  $S$  of real numbers by  $\text{Inf} S$  and  $\text{Sup} S$  we denote the infimum and the supremum of  $S$  with respect to  $\leq$ , respectively. By  $\langle 0, 1 \rangle$  we denote the set of all real numbers  $r$  with  $0 \leq r \leq 1$ .

Let  $U$  be an arbitrary non-empty set called universe. A fuzzy set  $F$  on  $U$  is a mapping  $F : U \rightarrow \langle 0, 1 \rangle$ , i. e. we do not distinguish between a fuzzy set  $F$  and its membership function  $\mu_F$ . The set of all fuzzy sets on  $U$  is denoted by  $F\mathbb{P}(U)$ .

---

\*Long version of a paper originally published in *28th International Symposium on Multiple-Valued Logic (ISMVL '98)*, Fukuoko, Japan, May 27–29, 1998

We introduce the empty fuzzy set  $\emptyset$  on  $U$  and the universal fuzzy set  $\mathcal{U}$  on  $U$ , respectively, for every  $x \in U$  defined by

$$\begin{aligned} \emptyset(x) &= 0 \\ \text{and } \mathcal{U}(x) &= 1 . \end{aligned}$$

As usual we define the support  $\text{supp}(F)$  of a fuzzy set  $F$  on  $U$  by

$$\text{supp}(F) = \{x \mid x \in U \wedge F(x) > 0\} .$$

A fuzzy set  $F$  is said to be finite and a singleton if and only if  $\text{supp}(F)$  is finite and  $\text{card } \text{supp}(F) = 1$ , respectively.

For  $F, G \in F\mathbb{P}(U)$  as usual we put

$$F \sqsubseteq G =_{\text{def}} \forall x (x \in U \rightarrow F(x) \leq G(x))$$

and for  $x \in U$  we define

$$\begin{aligned} (F \sqcap G)(x) &=_{\text{def}} \min(F(x), G(x)) \\ (F \sqcup G)(x) &=_{\text{def}} \max(F(x), G(x)) . \end{aligned}$$

Furthermore, for arbitrary  $\mathfrak{F} \subseteq F\mathbb{P}(U)$ ,  $x \in U$  we put

$$\begin{aligned} (\text{INF } \mathfrak{F})(x) &=_{\text{def}} \text{Inf}\{F(x) \mid F \in \mathfrak{F}\} \\ (\text{SUP } \mathfrak{F})(x) &=_{\text{def}} \text{Sup}\{F(x) \mid F \in \mathfrak{F}\} . \end{aligned}$$

**Remark**

The operations  $\sqcap, \sqcup, \text{INF}, \text{SUP}$  are defined in the “standard sense” and used throughout the paper presented. In a forthcoming paper we shall discuss the case if  $\min$  and  $\max$  are replaced by an arbitrary  $t$ -norm  $\tau$  and an  $s$ -Norm ( $t$ -conorm)  $\sigma$ , respectively. Furthermore,  $\text{INF}$  and  $\text{SUP}$  should be replaced by the quantifier  $Q_\tau$  and  $Q_\sigma$ , respectively (see [16–19]).

Finally, remember the following

**Theorem 1**

$$\mathbb{L} = [\mathbb{P}(U), \cap, \cup, \emptyset, U]$$

and

$$L = [F\mathbb{P}(U), \sqcap, \sqcup, \emptyset, \mathcal{U}]$$

are complete lattices.

In the following chapters 2 and 3 we repeat some facts more or less well-known from lattice theory and universal algebra.

## 2 A Bijection between Closure Operators and Closure Systems of Complete Lattices

Let  $\mathcal{L} = [L, \wedge, \vee, 0, u]$  be a complete lattice. Assume that  $\varphi : L \rightarrow L$  and  $C \subseteq L$ .

### Definition 1

1.  $\varphi$  is said to be monotone on  $\mathcal{L} =_{\text{def}} \forall x \forall y (x, y \in L \wedge x \preceq y \rightarrow \varphi(x) \preceq \varphi(y))$
2.  $\varphi$  is said to be embedding on  $\mathcal{L} =_{\text{def}} \forall x (x \in L \rightarrow x \preceq \varphi(x))$
3.  $\varphi$  is said to be closed on  $\mathcal{L} =_{\text{def}} \forall x (x \in L \rightarrow \varphi(\varphi(x)) \preceq \varphi(x))$
4.  $\varphi$  is said a closure operator of  $\mathcal{L} =_{\text{def}} \varphi$  fulfils the conditions 1, 2, and 3.

### Definition 2

$C$  is said to be a closure system of  $\mathcal{L} =_{\text{def}} \forall D (D \subseteq C \rightarrow \inf D \in C)$

### Definition 3

1.  $\text{SET}(\varphi) =_{\text{def}} \{c \mid c \in L \wedge \varphi(c) \preceq c\}$
2.  $\text{FCT}(C)(x) =_{\text{def}} \inf \{y \mid x \preceq y \wedge y \in C\}$

### Lemma 2

If  $\varphi$  is monotone on  $\mathcal{L}$ , then  $\text{SET}(\varphi)$  is a closure system of  $\mathcal{L}$ .

### Proof

Assume

$$(1) \quad D \subseteq \text{SET}(\varphi), \text{ i. e.}$$

$$(2) \quad \forall d (d \in D \rightarrow \varphi(d) \preceq d)$$

We have to prove

$$(3) \quad \varphi(\inf D) \preceq \inf D.$$

In order to prove (3) it is sufficient to show

$$(4) \quad \forall d (d \in D \rightarrow \varphi(\inf D) \preceq d)$$

From  $d \in D$  we get

$$(5) \quad \inf D \preceq d$$

hence by monotonicity of  $\varphi$

$$(6) \quad \varphi(\inf D) \preceq \varphi(d)$$

hence by (2) we obtain (4). ■

### Lemma 3

If  $\varphi$  is embedding and closed on  $\mathcal{L}$ , then

$$\forall x (x \in L \rightarrow \text{FCT}(\text{SET}(\varphi))(x) \preceq \varphi(x))$$

**Proof**

By definition 3 we have

$$\begin{aligned}
 & \text{FCT}(\text{SET}(\varphi))(x) \\
 (1) \quad & = \inf\{y \mid x \preceq y \wedge y \in \text{SET}(\varphi)\} \\
 & = \inf\{y \mid x \preceq y \wedge \varphi(y) \preceq y \wedge y \in L\}
 \end{aligned}$$

In order to prove lemma 3 it is sufficient to show

$$(2) \quad \exists y_0 (y_0 \in L \wedge x \preceq y_0 \wedge \varphi(y_0) \preceq y_0).$$

We put

$$(3) \quad y_0 =_{\text{def}} \varphi(x).$$

Then we get

$$(4) \quad \varphi(x) \in L,$$

$$(5) \quad x \preceq \varphi(x) \text{ by embedding of } \varphi,$$

$$(6) \quad \varphi(\varphi(x)) \preceq \varphi(x) \text{ by closedness of } \varphi,$$

hence lemma 3 holds. ■

**Lemma 4**

If  $\varphi$  is monotone on  $\mathcal{L}$ , then

$$\forall x (x \in L \rightarrow \varphi(x) \preceq \text{FCT}(\text{SET}(\varphi))(x))$$

**Proof**

For every  $x \in L$  we have to prove

$$(1) \quad \varphi(x) \preceq \inf\{y \mid y \in L \wedge x \preceq y \wedge \varphi(y) \preceq y\}.$$

In order to prove (1) it is sufficient to show

$$(2) \quad \forall y (y \in L \wedge x \preceq y \wedge \varphi(y) \preceq y \rightarrow \varphi(x) \preceq y)$$

From  $x \preceq y$  by monotonicity of  $\varphi$  we get  $\varphi(x) \preceq \varphi(y)$ , hence  $\varphi(x) \preceq y$  because of  $\varphi(y) \preceq y$ . ■

**Theorem 5**

If  $\varphi$  is a closure operator of  $\mathcal{L}$ , then

$$\text{FCT}(\text{SET}(\varphi)) = \varphi$$

**Proof**

By lemma 3 and lemma 4 ■

**Corollary 6**

SET is an injection from the set of all closure operators of  $\mathcal{L}$  into the set of all closure systems of  $\mathcal{L}$ .

**Proof**

By lemma 2 and theorem 5 ■

**Lemma 7**

For every subset  $C \subseteq L$ ,

1.  $\text{FCT}(C)$  is embedding and
2.  $\text{FCT}(C)$  is monotone.

**Proof**

Trivially on the basis of definition 3 ■

**Lemma 8**

For every subset  $C \subseteq L$ ,

if  $C$  is a closure system of  $\mathcal{L}$ , then

1.  $\text{FCT}(C)$  is a closure operator and
2.  $\text{SET}(\text{FCT}(C)) \subseteq C$ .

**Proof**

**ad 1** Because of lemma 7 it is sufficient to show that  $\text{FCT}(C)$  is closed, i. e.

$$(1) \quad \forall x(x \in L \rightarrow \text{FCT}(C)(\text{FCT}(C)(x)) \preceq \text{FCT}(C)(x)).$$

On the basis of definition 3 it is sufficient to show

$$(2) \quad \inf\{y \mid \text{FCT}(C)(x) \preceq y \wedge y \in C\} \preceq \text{FCT}(C)(x)$$

In order to prove (2) it is sufficient to show

$$(3) \quad \exists y(\text{FCT}(C)(x) \preceq y \wedge y \in C \wedge y \preceq \text{FCT}(C)(x))$$

We put

$$(4) \quad y =_{\text{def}} \text{FCT}(C)(x).$$

In order to prove (3) it is sufficient to show

$$(5) \quad \text{FCT}(C)(x) \in C.$$

But, (5) holds because  $C$  is a closure system.

**ad 2** We have to show

$$(6) \quad \forall x(x \in L \wedge x \in \text{SET}(\text{FCT}(C)) \rightarrow x \in C)$$

For  $x \in L$  we assume

$$(7) \quad x \in \text{SET}(\text{FCT}(C)),$$

hence by definition of SET

$$(8) \quad \text{FCT}(C)(x) \preceq x$$

Because of lemma 7,  $\text{FCT}(C)$  is embedding, i. e.

$$(9) \quad x \preceq \text{FCT}(C)(x),$$

hence from (8) and (9) we get

$$(10) \quad \text{FCT}(C)(x) = x.$$

Furthermore, by definition 3 we have

$$(11) \quad \text{FCT}(C)(x) = \inf\{y \mid x \preceq y \wedge y \in C\}$$

Now, we assumed that  $C$  is a closure system, hence

$$(12) \quad \inf\{y \mid x \preceq y \wedge y \in C\} \in C,$$

hence by (10) we get  $x \in C$ . ■

**Lemma 9**

For every subset  $C \subseteq L$ ,

$$C \subseteq \text{SET}(\text{FCT}(C)).$$

**Proof**

Assume

$$(1) \quad x \in C$$

In order to prove

$$(2) \quad x \in \text{SET}(\text{FCT}(C)),$$

using the definition of SET it is sufficient to show

$$(3) \quad \text{FCT}(C)(x) \preceq x,$$

hence by definition of FCT it is sufficient to show

$$(4) \quad \inf\{y \mid x \preceq y \wedge y \in C\} \preceq x.$$

But (4) holds because of  $x \in C$ . ■

**Theorem 10**

If  $C$  is a closure system of  $\mathcal{L}$ , then  $\text{SET}(\text{FCT}(C)) = C$ .

**Proof**

By lemma 8 and lemma 9 ■

**Corollary 11**

1. SET is a bijection from the set of all closure operators of  $\mathcal{L}$  onto the set of all closure systems of  $\mathcal{L}$ .
2. FCT is the inversion of the mapping SET.

**Proof**

By theorem 5 and theorem 10 ■

Now, we are going to add some concepts of topology.

**Definition 4**

1.  $\varphi$  is said to be a topological mapping on  $\mathcal{L}$   
 $=_{\text{def}} \forall x \forall y (x, y \in L \rightarrow \varphi(x \vee y) \preceq \varphi(x) \vee \varphi(y))$
2.  $C$  is said to be a topological set of  $\mathcal{L}$   
 $=_{\text{def}} \forall X (X \subseteq C \wedge X \text{ is finite} \wedge X \text{ is not empty} \rightarrow \text{Sup} X \in C)$

**Lemma 12**

If  $\varphi$  is a topological mapping on  $\mathcal{L}$ , then  $\text{SET}(\varphi)$  is a topological set of  $\mathcal{L}$ .

**Proof**

Let  $X$  be an arbitrary non-empty finite subset of  $\mathcal{L}$ . Because  $\varphi$  is a topological mapping, we get

$$(1) \quad \varphi(\sup X) \cong \sup\{\varphi(x) \mid x \in X\}$$

Now, we assume additionally that

$$(2) \quad X \subseteq \text{SET}(\varphi), \text{ i. e. } \forall x(x \in X \rightarrow \varphi(x) \cong x),$$

hence we get

$$(3) \quad \sup\{\varphi(x) \mid x \in X\} \cong \sup X,$$

consequently (1) and (3) imply

$$(4) \quad \varphi(\sup X) \cong \sup X, \text{ i. e. } \sup X \in \text{SET}(\varphi)$$

■

**Lemma 13**

If  $C$  is a closure system of  $\mathcal{L}$  and  $C$  is a topological set of  $\mathcal{L}$ , then  $\text{FCT}(C)$  is a topological mapping on  $\mathcal{L}$ .

**Proof**

We have to prove

$$(1) \quad \forall x \forall y (x, y \in L \rightarrow \text{FCT}(C)(x \vee y) \cong \text{FCT}(C)(x) \vee \text{FCT}(C)(y))$$

In order to prove (1) it is sufficient to show

$$(2) \quad \inf\{z \mid x \vee y \cong z \wedge z \in C\} \cong \inf\{z \mid x \cong z \wedge z \in C\} \vee \inf\{z \mid y \cong z \wedge z \in C\}$$

Because  $C$  is a closure system of  $\mathcal{L}$ , we have

$$(3) \quad \inf\{z \mid x \cong z \wedge z \in C\} \in C$$

and

$$(4) \quad \inf\{z \mid y \cong z \wedge z \in C\} \in C,$$

hence, because  $C$  is a topological set of  $\mathcal{L}$ , we get

$$(5) \quad \inf\{z \mid x \cong z \wedge z \in C\} \vee \inf\{z \mid y \cong z \wedge z \in C\} \in C$$

Thus, in order to prove (2), it is sufficient to show

$$(6) \quad x \vee y \cong \inf\{z \mid x \cong z \wedge z \in C\} \vee \inf\{z \mid y \cong z \wedge z \in C\}$$

But (6) follows from

$$(7) \quad x \cong \inf\{z \mid x \cong z \wedge z \in C\}$$

and

$$(8) \quad y \cong \inf\{z \mid y \cong z \wedge z \in C\}.$$

■

**Theorem 14**

If  $\varphi$  is a closure operator of  $\mathcal{L}$ , then

$\varphi$  is a topological mapping on  $\mathcal{L}$  if and only if  $\text{SET}(\varphi)$  is a topological set of  $\mathcal{L}$ .

**Proof**

**ad 1** ( $\Downarrow$ ) Trivial by lemma 12

**ad 2** ( $\Uparrow$ ) By theorem 5 we have

$$(1) \quad \varphi = \text{FCT}(\text{SET}(\varphi)).$$

Hence by lemma 13 it is sufficient to show that

$$(2) \quad \text{SET}(\varphi) \text{ is a closure system of } \mathcal{L}$$

and

$$(3) \quad \text{SET}(\varphi) \text{ is a topological set of } \mathcal{L}.$$

But, (2) holds because of lemma 2. Furthermore, (3) is an assumption in case considered.

■

**Theorem 15**

If  $C$  is a closure system, then

$C$  is a topological set of  $\mathcal{L}$  if and only if  $\text{FCT}(C)$  is a topological mapping of  $\mathcal{L}$ .

**Proof**

**ad 1** ( $\Downarrow$ ) Trivially by lemma 13

**ad 2** ( $\Uparrow$ ) Because  $C$  is a closure system, by theorem 10 we get

$$(1) \quad C = \text{SET}(\text{FCT}(C)),$$

hence by lemma 12, it is sufficient to show that

$$(2) \quad \text{FCT}(C) \text{ is a topological mapping of } \mathcal{L}.$$

But, (2) holds by assumption in case considered.

■

### 3 On Compactness of Classical Closure Operators. Algebraic Closure Operators. The Theorem of G. BIRKHOFF, P. HALL, and J. SCHMIDT.

We continue with the formulation of the fundamental theorem due to G. BIRKHOFF, P. HALL, and J. SCHMIDT which is important in many branches of algebra and which gives an algebraic characterization of the (classical) monotonic reasoning (see [9], also [6]). In particular, by this theorem the range of applicability of ZORN'S lemma is well defined (see [9]).

In order to formulate this theorem, we fix an arbitrary non-empty set  $U$  and consider the complete lattice

$$\mathbb{L} = [\mathbb{P}(U), \cap, \cup, \emptyset, U]$$

where  $\mathbb{P}(U)$  is the power set of  $U$ ,  $\cap$  and  $\cup$  are the set-theoretical intersection and union of subsets of  $U$ , respectively. Furthermore,  $\emptyset$  denotes the empty set, and the set  $U$  plays the role of the unit element of  $\mathbb{L}$ .

Because  $\mathbb{L}$  is a complete lattice all the considerations, concepts, and results of chapter 2 can be applied to  $\mathbb{L}$ .

For a mapping  $\Phi: \mathbb{P}(U) \rightarrow \mathbb{P}(U)$  and a system  $\mathfrak{C} \subseteq \mathbb{P}(U)$  of subsets of  $U$  we define the following well-known fundamental concepts:

**Definition 5**

1.  $\Phi$  is said to be compact on  $\mathbb{L}$

$$=_{\text{def}} \forall X \forall y (X \subseteq U \wedge y \in \Phi(X) \rightarrow \exists X_{fin} (X_{fin} \subseteq X \wedge X_{fin} \text{ is finite} \wedge y \in \Phi(X_{fin}))$$

2.  $\Phi$  is said to be strongly compact on  $\mathbb{L}$

$$=_{\text{def}} \forall X \forall y \left( X \subseteq U \wedge y \in X \wedge y \in \Phi(X) \rightarrow \exists X_{sing} (X_{sing} \subseteq X \wedge \text{card } X_{sing} \leq 1 \wedge y \in \Phi(X_{sing})) \right)$$

3.  $\Phi$  is said to be inductive on  $\mathbb{L}$

$$=_{\text{def}} \forall \mathfrak{K} \left( \mathfrak{K} \subseteq \mathbb{P}(U) \wedge \mathfrak{K} \neq \emptyset \wedge \mathfrak{K} \text{ is a chain} \rightarrow \Phi \left( \bigcup \mathfrak{K} \right) \subseteq \bigcup \{ \Phi(K) \mid K \in \mathfrak{K} \} \right)$$

4.  $\mathfrak{C}$  is said to be inductive on  $\mathbb{L}$

$$=_{\text{def}} \forall \mathfrak{K} \left( \mathfrak{K} \subseteq \mathfrak{C} \wedge \mathfrak{K} \neq \emptyset \wedge \mathfrak{K} \text{ is a chain} \rightarrow \bigcup \mathfrak{K} \in \mathfrak{C} \right)$$

In order to describe the generation of closure operators by universal algebras and deductive systems, respectively, we introduce the following notions. Let  $n$  be an integer with  $n \geq 0$  and assume that  $X \subseteq U$ .

**Definition 6**

1.  $\omega$  is said to be a (total)  $n$ -ary operation on  $U$  if and only if  $\omega$  is a mapping

$$\omega: U^n \rightarrow U \quad (n \geq 0).$$

If  $n$  is not specified, we will speak of a finitary operation on  $U$ .

2.  $A = [U, \Omega]$  is said to be a (total) algebra on  $U$  if and only if  $\Omega$  is a set of finitary operations on  $U$ .
3. For given  $X \subseteq U$  we put

$$\overline{\Omega}(X) =_{\text{def}} \left\{ y \mid \begin{array}{l} \text{there exists an integer } n \geq 0, \text{ an } n\text{-ary operation } \omega \in \Omega \\ \text{and } x_1, \dots, x_n \in X \text{ such that } y = \omega(x_1, \dots, x_n) \end{array} \right\}$$

4.  $X \subseteq U$  is said to be  $\Omega$ -closed if and only if  $\overline{\Omega}(X) \subseteq X$ .

**Definition 7**

1.  $\Phi_{\mathfrak{C}}(X) =_{\text{def}} \bigcap \{ C \mid X \subseteq C \wedge C \in \mathfrak{C} \}$
2.  $\Phi_{\Omega}(X) =_{\text{def}} \bigcap \{ C \mid X \subseteq C \subseteq U \wedge \overline{\Omega}(C) \subseteq C \}$
3.  $\mathfrak{C}_{\Phi} =_{\text{def}} \{ C \mid C \subseteq U \wedge \Phi(C) \subseteq C \}$

$$4. \mathfrak{C}_\Omega =_{\text{def}} \{C \mid C \subseteq U \wedge \overline{\Omega}(C) \subseteq C\}$$

For many applications, in particular in logic, it is convenient to generalize the notion of *deterministic* finitary operation introduced by definition 6 to the concept of finitary *non-deterministic, partial* operation (see [9]). With respect to applications in logic, we prefer the term *deduction rule* in this case.

**Definition 8**

1.  $d$  is said to be an  $n$ -ary deduction rule on  $U$  if and only if

$$d \subseteq U^n \times U \quad (n \geq 0).$$

If  $n$  is not specified, then  $d$  is called a finitary deduction rule on  $U$ .

2.  $\mathfrak{D} = [U, D]$  is said to be a deductive system on  $U$  if and only if  $D$  is a set of finitary deduction rules on  $U$ , i. e. if  $D \subseteq U^* \times U$ .
3. For given  $X \subseteq U$  we put

$$\overline{D}(X) =_{\text{def}} \left\{ y \mid \begin{array}{l} \text{there exists a natural number } n \geq 0, n\text{-ary deduction rule} \\ d \in D \text{ and } x_1, \dots, x_n \in X \text{ such that } [x_1, \dots, x_n; y] \in d \end{array} \right\}.$$

4.  $X \subseteq U$  is said to be  $D$ -closed if and only if  $\overline{D}(X) \subseteq X$ .
5.  $\Phi_D(X) =_{\text{def}} \bigcap \{C \mid X \subseteq C \subseteq U \wedge \overline{D}(C) \subseteq C\}$
6.  $\mathfrak{C}_D(X) =_{\text{def}} \{C \mid C \subseteq U \wedge \overline{D}(C) \subseteq C\}$

**Remark**

The definitions of  $\Phi_{\mathfrak{C}}$ ,  $\Phi_\Omega$ , and  $\Phi_D$  correspond to the definition of  $\text{FCT}(C)$  (see definition 3). Analogously, the definitions of  $\mathfrak{C}_\Phi$ ,  $\mathfrak{C}_\Omega$ , and  $\mathfrak{C}_D$  correspond to the definition of  $\text{SET}(C)$  (see definition 3).

Now, we are able to formulate the theorem due to G. BIRKHOFF, P. HALL, and J. SCHMIDT:

**Theorem 16**

If  $\Phi$  is a closure operator on  $\mathbb{L}$ , then the following propositions 1, 2, 3, 4, and 5 are pairwise equivalent:

1.  $\Phi$  is compact on  $\mathbb{L}$ .
2.  $\Phi$  is inductive on  $\mathbb{L}$ .
3.  $\mathfrak{C}_\Phi$  is inductive on  $\mathbb{L}$ .
4. there exists a set  $\Omega$  of finitary operations on  $U$  such that  $\Phi = \Phi_\Omega$ .
5. there exists a set  $D$  of finitary deduction rules on  $U$  such that  $\Phi = \Phi_D$ .

**Remarks**

1. Concerning history, we want to mention that the role of compactness in studying logical consequence operators was discovered and investigated by A. TARSKI in [11–13] and emphasized by K. SCHRÖTER in [10]. A. MALCEV introduced the model theoretic version of compactness and established its applicability in several branches of algebra (see [8]).
2. The equivalence of 3 and 4 was first proved by J. SCHMIDT in [9], but according to P. COHN in [6], page 81, is an unpublished result of P. HALL, and probably G. BIRKHOFF knew this result (at least part of it) even earlier (see [1–4]).

3. The equivalence of 1 and 3 was also discovered by J. SCHMIDT and first proved in [9]. He also pointed out the importance of inductive systems of sets for applying ZORN's lemma, where it should be mentioned that the notion of inductiveness can already be found in [5].
4. A proof for the equivalence of 3 and 5 can also be found in [9], with the only difference that the term "finitary deduction rule" is not used there.
5. The equivalence of 2 and 3 is added in this paper. A proof can be carried out easily by using the methods developed in [9].
6. Using the concept of *Clone* (see [6], for instance) we can prove the following modification of theorem 16: In proposition 4 and 5  $\Omega$  and  $D$  can be taken to be clones of operations and deduction rules, respectively, where a clone of deduction rules is defined in the same way as a clone of operations. If we intend to construct a clone of operations (or deduction rules) by a given compact closure operator  $\Phi$ , we shall see that the existence of the projection operations follows from the reflexivity of  $\Phi$ , whereas the monotonicity and the closedness of  $\Phi$  together imply that the system of operations (deduction rules) is closed with respect to compositions.

Starting with a closure system, we can prove the following

**Theorem 17**

*If  $\mathfrak{C}$  is a closure system of  $\mathbb{L}$ , then the following propositions 1, 2, 3, 4, and 5 are pairwise equivalent:*

1.  $\mathfrak{C}$  is inductive on  $\mathbb{L}$
2.  $\Phi_{\mathfrak{C}}$  is inductive on  $\mathbb{L}$
3.  $\Phi_{\mathfrak{C}}$  is compact on  $\mathbb{L}$
4. there exists a set  $\Omega$  of finitary operations on  $U$  such that  $\mathfrak{C} = \mathfrak{C}_{\Omega}$
5. there exists a set  $D$  of finitary deduction rules on  $U$  such that  $\mathfrak{C} = \mathfrak{C}_D$ .

Combining the algebraic with the topological concept we obtain the following (possibly not very well-known) theorems:

**Theorem 18**

*If  $\Phi$  is a closure operator on  $\mathbb{L}$ , then the following propositions 1, 2, 3, 4, 5, and 6 are pairwise equivalent:*

1.  $\Phi$  is compact and topological on  $\mathbb{L}$ ;
2.  $\Phi$  is strongly compact on  $\mathbb{L}$ ;
3.  $\Phi$  is inductive and topological on  $\mathbb{L}$ ;
4.  $\mathfrak{C}_{\Phi}$  is inductive and topological on  $\mathbb{L}$ ;
5. there exists a set  $\Omega$  of 1-ary operations on  $U$  such that  $\Phi = \Phi_{\Omega}$ ;
6. there exists a set  $D$  of 1-ary deduction rules of  $U$  such that  $\Phi = \Phi_D$ .

**Theorem 19**

*If  $\mathfrak{C}$  is a closure system of  $\mathbb{L}$ , then the following propositions 1, 2, 3, 4, and 5 are pairwise equivalent:*

1.  $\mathfrak{C}$  is inductive and topological on  $\mathbb{L}$
2.  $\Phi_{\mathfrak{C}}$  is inductive and topological on  $\mathbb{L}$

3.  $\Phi_{\mathcal{C}}$  is strongly compact on  $\mathbb{L}$
4. there exists a set  $\Omega$  of 1-ary operations on  $U$  such that  $\mathcal{C} = \mathcal{C}_{\Omega}$
5. there exists a set  $D$  of 1-ary deduction rules on  $U$  such that  $\mathcal{C} = \mathcal{C}_D$ .

## 4 On Closure Operators generated in Fuzzy Algebras and in Fuzzy Deductive Systems

Now, we intend to “fuzzify” the concepts and results of chapter 3.

We remember that

$$L = [F\mathbb{P}(U), \sqcap, \sqcup, \emptyset, \mathcal{U}]$$

is a complete lattice where  $F\mathbb{P}(U)$  is the set of all fuzzy sets on  $U$ , furthermore,  $\sqcap$  and  $\sqcup$  denote the intersection and union of fuzzy sets based on the minimum and maximum function, respectively, and finally,  $\emptyset$  and  $\mathcal{U}$  are the empty and the universal fuzzy set on  $U$ , respectively.

Thus, all considerations of chapter 2 can be applied to the complete lattice  $L$ .

For formulating the following definition we assume that  $\Psi : F\mathbb{P}(U) \rightarrow F\mathbb{P}(U)$ ,  $\vartheta \subseteq F\mathbb{P}(U)$ , and  $I$  is a prime minimum-ideal from  $\langle 0, 1 \rangle$ .

### Definition 9

1.  $\Psi$  is said to be compact on  $L$

$$=_{\text{def}} \forall F \forall y \left( \begin{array}{l} F \in F\mathbb{P}(U) \wedge y \in U \\ \rightarrow \exists F_{fin} \left( \begin{array}{l} F_{fin} \in F\mathbb{P}(U) \wedge F_{fin} \sqsubseteq F \wedge F_{fin} \text{ is finite} \\ \wedge \Psi(F)(y) \leq \Psi(F_{fin})(y) \end{array} \right) \end{array} \right)$$

2.  $\Psi$  is said to be strongly compact on  $L$

$$=_{\text{def}} \forall F \forall y \left( \begin{array}{l} F \in F\mathbb{P}(U) \wedge y \in U \\ \rightarrow \exists F_{sing} \left( \begin{array}{l} F_{sing} \in F\mathbb{P}(U) \wedge F_{sing} \sqsubseteq F \wedge F_{sing} \text{ is a singleton} \\ \wedge \Psi(F)(y) \leq \Psi(F_{sing})(y) \end{array} \right) \end{array} \right)$$

3.  $\Psi$  is said to be inductive on  $L$

$$=_{\text{def}} \forall \mathcal{K} (\mathcal{K} \subseteq F\mathbb{P}(U) \wedge \mathcal{K} \neq \emptyset \wedge \mathcal{K} \text{ is a chain} \rightarrow \Psi(\text{SUP } \mathcal{K}) \sqsubseteq \text{SUP } \{\Psi(K) \mid K \in \mathcal{K}\})$$

4.  $\vartheta$  is said to be inductive on  $L$

$$=_{\text{def}} \forall \mathcal{K} (\mathcal{K} \subseteq \mathcal{C} \wedge \mathcal{K} \neq \emptyset \wedge \mathcal{K} \text{ is a } \sqsubseteq\text{-chain} \rightarrow \text{SUP } \mathcal{K} \in \mathcal{C})$$

Now, we are going to define the concept of an  $n$ -ary fuzzy operation on  $U$  and of an  $n$ -ary fuzzy deduction rule on  $U$ .

### Definition 10

1.  $\pi$  is said to be a (total)  $n$ -ary  $I$ -fuzzy operation on  $U$

$$=_{\text{def}} \text{ a) } \pi : U^n \times U \rightarrow \langle 0, 1 \rangle \text{ and}$$

$$\text{ b) } \forall x_1 \cdots \forall x_n (x_1, \dots, x_n \in U \rightarrow \exists y (y \in U \wedge \pi(x_1, \dots, x_n, y) \in I))$$

$$c) \forall x_1 \cdots x_n \forall y \forall y' \left( \begin{array}{l} x_1, \dots, x_n, y, y' \in U \\ \wedge \pi(x_1, \dots, x_n, y) \in I \wedge \pi(x_1, \dots, x_n, y') \in I \rightarrow y = y' \end{array} \right)$$

If  $n$  is not specified we will speak of a (total) finitary  $I$ -fuzzy operation on  $U$  with respect to  $I$ .

2.  $F = [U, \Pi]$  is said to be a (total)  $I$ -fuzzy operation on  $U$   
 $=_{\text{def}} \Pi$  is a set of (total) finitary  $I$ -fuzzy operations on  $U$ .
3. For a given fuzzy set  $F \in F\mathbb{P}(U)$  we put

$$\bar{\Pi}(F)(y) =_{\text{def}} \text{Sup} \left\{ \min(F(x_1), \dots, F(x_n), \pi(x_1, \dots, x_n; y)) \mid n \in \mathbb{N} \wedge x_1, \dots, x_n, y \in U \wedge \pi \in \Pi \wedge \pi \text{ is } n\text{-ary} \right\}$$

4.  $F$  is said to be  $\Pi$ -closed  
 $=_{\text{def}} \bar{\Pi}(F) \sqsubseteq F$
5.  $\Psi_{\Pi}(F) =_{\text{def}} \text{INF} \{ G \mid G \in F\mathbb{P}(U) \wedge F \sqsubseteq G \wedge \bar{\Pi}(G) \sqsubseteq G \}$

Now, we are going to fuzzify the concept of deduction rule.

### Definition 11

1.  $\delta$  is said to be an  $n$ -ary fuzzy deduction rule on  $U$

$$=_{\text{def}} \delta : U^n \times U \rightarrow \langle 0, 1 \rangle .$$

2. If  $n$  is not specified, we will speak of a finitary fuzzy deduction rule on  $U$ . If  $x_1, \dots, x_n, y \in U$ , then we interpret the real number

$$\delta(x_1, \dots, x_n, y)$$

as the logical value that the fuzzy deduction rule  $\delta$  has the output  $y$  for the inputs  $x_1, \dots, x_n$ .

3.  $\vartheta = [U, \Delta]$  is said to be a fuzzy deductive system on  $U$   
 $=_{\text{def}} \Delta$  is a set of finitary fuzzy deduction rules on  $U$ .
4. For a given fuzzy set  $F \in F\mathbb{P}(U)$  we put

$$\bar{\Delta}(F)(y) =_{\text{def}} \text{Sup} \left\{ \min(F(x_1), \dots, F(x_n), \delta(x_1, \dots, x_n; y)) \mid n \in \mathbb{N} \wedge x_1, \dots, x_n \in U \wedge \delta \in \Delta \wedge \delta \text{ is } n\text{-ary} \right\}$$

5.  $F$  is said to be  $\Delta$ -closed  
 $=_{\text{def}} \bar{\Delta}(F) \sqsubseteq F$
6.  $\Psi_{\Delta}(F) =_{\text{def}} \text{INF} \{ G \mid G \in F\mathbb{P}(U) \wedge F \sqsubseteq G \wedge \bar{\Delta}(G) \sqsubseteq G \}$

Because every  $n$ -ary  $I$ -fuzzy operation can be considered as a special case of an  $n$ -ary fuzzy deduction rule, we formulate the following definitions, lemmata, and theorems only for finitary fuzzy deduction rules.

### Lemma 20

The mapping

$$\bar{\Delta} : F\mathbb{P}(U) \rightarrow F\mathbb{P}(U)$$

is monotone on  $L$ .

**Proof**

For  $F, G \in F\mathbb{P}(U)$  assume

$$(1) \quad F \sqsubseteq G .$$

We have to prove

$$(2) \quad \overline{\Delta}(F) \sqsubseteq \overline{\Delta}(G), \text{ i. e.}$$

$$(3) \quad \forall y (y \in U \rightarrow \overline{\Delta}(F)(y) \leq \overline{\Delta}(G)(y)) .$$

By definition of  $\overline{\Delta}$  we have

$$(4) \quad \overline{\Delta}(F)(y) = \text{Sup} \left\{ \min(F(x_1), \dots, F(x_n), \delta(x_1, \dots, x_n, y)) \mid n \in \mathbb{N} \wedge \delta \in \Delta \wedge \delta \text{ is } n\text{-ary} \wedge x_1, \dots, x_n \in U \right\}$$

hence by monotonicity of min and Sup from (1) we get (3). ■

**Theorem 21**

1. The set  $\{F \mid F \in F\mathbb{P}(U) \wedge \overline{\Delta}(F) \sqsubseteq F\}$  of all  $\Delta$ -closed fuzzy sets  $F$  on  $U$  is a closure system of the lattice  $L$ .
2.  $\Psi_\Delta$  is a closure operator of the lattice  $L$ .

**Proof**

**ad 1** By theorem 1, lemma 20, and lemma 2.

**ad 2** By theorem 1, theorem 21, and lemma 8. ■

**Definition 12**

1.  $\Delta^{[0]}(F) =_{\text{def}} F$
2.  $\Delta^{[k+1]}(F) =_{\text{def}} \Delta^{[k]}(F) \sqcup \overline{\Delta}(\Delta^{[k]}(F))$
3.  $\Delta^{[*]}(F) =_{\text{def}} \text{SUP} \{ \Delta^{[k]}(F) \mid k \in \mathbb{N} \}$

The following concepts of modality of a set  $\Delta$  of fuzzy deduction rules is sufficient that some of the following theorems can be proved.

**Definition 13**

1.  $\Delta$  is said to be submodal with respect to  $L$

$$=_{\text{def}} \forall y \forall F \left( \left( y \in U \wedge F \in F\mathbb{P}(U) \rightarrow \exists n \exists \delta \exists x_1 \dots x_n \left( \begin{array}{l} n \in \mathbb{N} \wedge \delta \in \Delta \wedge \delta \text{ is } n\text{-ary} \wedge x_1, \dots, x_n \in U \wedge \\ \overline{\Delta}(F)(y) = \min(F(x_1), \dots, F(x_n), \delta(x_1, \dots, x_n, y)) \end{array} \right) \right) \right)$$

2.  $\Delta$  is said to be strongly submodal with respect to  $L$

$=_{\text{def}}$  2.1.  $\Delta$  is submodal with respect to  $U$  and

$$2.2. \forall y \forall F \left( y \in U \wedge F \in F\mathbb{P}(U) \rightarrow \exists k \left( k \in \mathbb{N} \wedge \Delta^{[*]}(F)(y) = \Delta^{[k]}(F)(y) \right) \right)$$

**Lemma 22**

If  $\Delta$  is strongly submodal with respect to  $L$ , then

$$\Psi_\Delta(F) \sqsubseteq \Delta^{[*]}(F) .$$

**Proof**

In order to prove the inclusion above, it is sufficient to show

$$(1) \quad F \sqsubseteq \Delta^{[*]}(F)$$

and

$$(2) \quad \overline{\Delta}(\Delta^{[*]}(F)) \sqsubseteq \Delta^{[*]}(F).$$

Proposition (1) holds trivially by definition of  $\Delta^{[*]}(F)$  (see definition 12). In order to prove (2) it is sufficient to show

$$(3) \quad \forall y \left( y \in U \rightarrow \exists k \left( k \in \mathbb{N} \wedge \overline{\Delta}(\Delta^{[*]}(F))(y) \leq \overline{\Delta}(\Delta^{[k]}(F)(y)) \right) \right)$$

By definition of  $\overline{\Delta}$  and the assumption of submodality for  $\Delta$  we obtain that there are  $n \in \mathbb{N}, x_1, \dots, x_n \in U, \delta \in \Delta$  such that  $\delta$  is  $n$ -ary and

$$(4) \quad \overline{\Delta}(\Delta^{[*]}(F))(y) = \min \left( \Delta^{[*]}(F)(x_1), \dots, \Delta^{[*]}(F)(x_n), \delta(x_1, \dots, x_n, y) \right)$$

Because of the strong submodality of  $\Delta$  there are  $k_1, \dots, k_n \in \mathbb{N}$  such that

$$(5) \quad \begin{array}{l} \Delta^{[*]}(F)(x_1) = \Delta^{[k_1]}(F)(x_1) \\ \vdots \\ \Delta^{[*]}(F)(x_n) = \Delta^{[k_n]}(F)(x_n), \end{array}$$

hence

$$(6) \quad \overline{\Delta}(\Delta^{[*]}(F))(y) = \min \left( \Delta^{[k_1]}(F)(x_1), \dots, \Delta^{[k_n]}(F)(x_n), \delta(x_1, \dots, x_n, y) \right).$$

Because we have

$$\Delta^{[k]}(F) \sqsubseteq \Delta^{[l]}(F)$$

if  $k \leq l$ , there exists a natural number  $m \in \mathbb{N}$

$$(7) \quad \begin{array}{l} \Delta^{[k_1]}(F)(x_1) \leq \Delta^{[m]}(F)(x_1) \\ \vdots \\ \Delta^{[k_1]}(F)(x_n) \leq \Delta^{[m]}(F)(x_n), \end{array}$$

hence by 6

$$(8) \quad \overline{\Delta}(\Delta^{[*]}(F))(y) \leq \min \left( \Delta^{[m]}(F)(x_1), \dots, \Delta^{[m]}(F)(x_n), \delta(x_1, \dots, x_n, y) \right),$$

hence

$$(9) \quad \overline{\Delta}(\Delta^{[*]}(F))(y) \leq \overline{\Delta}(\Delta^{[m]}(F))(y),$$

i. e. (3) holds. ■

**Lemma 23**

$$\Delta^{[*]}(F) \sqsubseteq \Psi_{\Delta}(F)$$

**Proof**

By definition of  $\Delta^{[*]}$  it is sufficient to prove

$$(1) \quad \Delta^{[k]}(F) \sqsubseteq \Psi_{\Delta}(F) \text{ for every } k \in \mathbb{N} .$$

By definition of  $\Psi_{\Delta}(F)$  it is sufficient to prove for  $G \in F\mathbb{P}(U)$  and  $k \in \mathbb{N}$

$$(2) \quad F \sqsubseteq G \wedge \bar{\Delta}(G) \sqsubseteq G \rightarrow \Delta^{[n]}(F) \sqsubseteq G .$$

But (2) will be proved by induction on  $n$ . The basic step  $n = 0$  is trivial. The induction step  $n$  is also trivial if we apply lemma 20, i. e.

$$(3) \quad F \sqsubseteq G \rightarrow \bar{\Delta}(F) \sqsubseteq \bar{\Delta}(G)$$

where  $F, G \in F\mathbb{P}(U)$ . ■

**Theorem 24**

If  $\Delta$  is strongly submodal with respect to  $L$ , then

$$\forall F (F \in F\mathbb{P}(U) \rightarrow \Psi_{\Delta}(F) = \Delta^{[*]}(F)) .$$

**Proof**

By lemma 22 and 23. ■

Now, we are going to prove the compactness of  $\Psi_{\Delta}$ . Therefore we start with the following lemma expressing the compactness of the mapping  $\Delta^{[k]}$  where  $k \in \mathbb{N}$  and  $k$  is fixed.

**Lemma 25**

If  $\Delta$  is submodal with respect to  $L$ , then

$$\forall k \forall y \forall F \left( k \in \mathbb{N} \wedge y \in U \wedge F \in F\mathbb{P}(U) \rightarrow \left( \exists F_{fin} (F_{fin} \in F\mathbb{P}(U) \wedge F_{fin} \sqsubseteq F \wedge F_{fin} \text{ is finite} \wedge \Delta^{[k]}(F)(y) \leq \Delta^{[k]}(F_{fin})(y)) \right) \right)$$

**Proof**

By induction on  $k$ .

Basic step.  $k = 0$

Then  $\Delta^{[0]}(F) = F$ , hence we put for  $x \in U$ ,

$$(1) \quad F_{fin}(x) =_{\text{def}} \begin{cases} F(x) & \text{if } x = y \\ 0 & \text{if } x \neq y . \end{cases}$$

Consequently,

$$(2) \quad \begin{aligned} F_{fin} &\in F\mathbb{P}(U), \\ F_{fin} &\sqsubseteq F, \\ F_{fin} &\text{ is finite,} \end{aligned}$$

finally

$$(3) \quad F(y) \leq F_{fin}(y) .$$

Induction step.

Assume that lemma 25 holds for fixed  $k \in \mathbb{N}$ , every  $F \in F\mathbb{P}(U)$ , and every  $y \in U$ .

By definition of  $\Delta^{[k+1]}$  we have

$$(4) \quad \Delta^{[k+1]}(F) = \Delta^{[k]}(F) \sqcup \overline{\Delta}(\Delta^{[k]}(F)),$$

i. e. for every  $y \in U$ ,

$$\Delta^{[k+1]}(F)(y) = \max\left(\Delta^{[k]}(F)(y), \overline{\Delta}(\Delta^{[k]}(F))(y)\right).$$

By induction assumption we get a fuzzy set  $F_{fin}$  with

$$(5) \quad \begin{aligned} F_{fin} &\in F\mathbb{P}(U), \\ F_{fin} &\sqsubseteq F, \\ F_{fin} &\text{ is finite,} \end{aligned}$$

$$(6) \quad \Delta^{[k]}(F)(y) \leq \Delta^{[k]}(F_{fin})(y).$$

Furthermore, because  $\Delta$  is submodal with respect to  $L$ , we get an  $n \in \mathbb{N}$ , elements  $x_1, \dots, x_n \in U$ , and an  $n$ -ary fuzzy deduction rule  $\delta \in \Delta$  such that

$$(7) \quad \overline{\Delta}(\Delta^{[k]}(F))(y) = \min(\Delta^{[k]}(F)(x_1), \dots, \Delta^{[k]}(F)(x_n), \delta(x_1, \dots, x_n, y)).$$

Now, by induction assumption for every  $i \in \{1, \dots, n\}$  we have an  $F_{fin}^i$  such that  $F_{fin}^i \in F\mathbb{P}(U)$ ,  $F_{fin}^i \sqsubseteq F$ ,  $F_{fin}^i$  is finite and

$$\Delta^{[k]}(F)(x_i) \leq \Delta^{[k]}(F_{fin}^i)(x_i).$$

We define  $F_{fin}^* =_{\text{def}} \text{SUP}\{F_{fin}^i \mid i \in \{1, \dots, n\}\}$ .

Then we have  $F_{fin}^* \in F\mathbb{P}(U)$ ,

$$(8) \quad \begin{aligned} F_{fin}^i &\sqsubseteq F_{fin}^* \sqsubseteq F \\ F_{fin}^* &\text{ is finite} \end{aligned}$$

and

$$(9) \quad \Delta^{[k]}(F)(x_i) \leq \Delta^{[k]}(F_{fin}^i)(x_i) \leq \Delta^{[k]}(F_{fin}^*)(x_i)$$

for every  $i \in \{1, \dots, n\}$ .

From (7) and (9) we obtain

$$(10) \quad \overline{\Delta}(\Delta^{[k]}(F))(y) \leq \min\left(\Delta^{[k]}(F_{fin}^*)(x_1), \dots, \Delta^{[k]}(F_{fin}^*)(x_n), \delta(x_1, \dots, x_n, y)\right).$$

We put

$$F_{fin}^{**} =_{\text{def}} F_{fin} \sqcup F_{fin}^*.$$

hence by (5) and (8) we get

$$(11) \quad \begin{aligned} F_{fin}^{**} &\in F\mathbb{P}(U) \\ F_{fin} &\sqsubseteq F_{fin}^{**} \sqsubseteq F \\ F_{fin}^* &\sqsubseteq F_{fin}^{**} \sqsubseteq F \\ F_{fin}^{**} &\text{ is finite.} \end{aligned}$$

By (6) we obtain

$$(12) \quad \Delta^{[k]}(F)(y) \leq \Delta^{[k]}(F_{fin})(y) \leq \Delta^{[k]}(F_{fin}^{**})(y).$$

Furthermore by (10) and (11)

$$(13) \quad \begin{aligned} & \bar{\Delta}(\Delta^{[k]}(F))(y) \\ & \leq \min\left(\Delta^{[k]}(F_{fin}^*)(x_1), \dots, \Delta^{[k]}(F_{fin}^*)(x_n), \delta(x_1, \dots, x_n, y)\right) \\ & \leq \min\left(\Delta^{[k]}(F_{fin}^{**})(x_1), \dots, \Delta^{[k]}(F_{fin}^{**})(x_n), \delta(x_1, \dots, x_n, y)\right) \\ & \leq \bar{\Delta}(\Delta^{[k]}(F_{fin}^{**}))(y) \end{aligned}$$

Finally, by (4), (12), and (13) we get

$$(14) \quad \Delta^{[k+1]}(F)(y) \leq \Delta^{[k+1]}(F_{fin}^{**})(y).$$

Thus, the induction step is finished. ■

### Theorem 26

If  $\Delta$  is strongly submodal, then  $\Psi_\Delta$  is compact, i. e.

$$\forall F \forall y \left( F \in F\mathbb{P}(U) \wedge y \in U \rightarrow \exists F_{fin} \left( \begin{array}{l} F_{fin} \in F\mathbb{P}(U) \wedge F_{fin} \sqsubseteq F \wedge F_{fin} \text{ is finite} \\ \wedge \Psi_\Delta(F)(y) \leq \Psi_\Delta(F_{fin})(y) \end{array} \right) \right)$$

### Proof

Because  $\Delta$  is strongly submodal by theorem 24 we get

$$(1) \quad \Psi_\Delta(F)(y) = \text{SUP}\{\Delta^{[k]}(F)(y) \mid k \in \mathbb{N}\},$$

because  $\Delta$  is strongly submodal, by definition 13 we have

$$(2) \quad \exists k (k \in \mathbb{N} \wedge \Psi_\Delta(F)(y) = \Delta^{[k]}(F)(y)),$$

thus, by lemma 25 we finish the proof of theorem 26. ■

Consider a mapping

$$\Psi : F\mathbb{P}(U) \rightarrow F\mathbb{P}(U).$$

We are going to investigate the problem under which conditions for  $\Psi$  there exists a set  $\Delta$  of fuzzy deduction rules on  $U$  such that

$$\Psi = \Psi_\Delta.$$

We start with the following lemma

### Lemma 27

$$\forall y \forall F (y \in U \wedge F \in F\mathbb{P}(U) \rightarrow \bar{\Delta}(F)(y) \leq \Psi_\Delta(F)(y))$$

**Proof**

By definition of  $\Psi_\Delta$  we have

$$(1) \quad \Psi_\Delta(F)(y) =_{\text{def}} \text{Inf} \left\{ G(y) \mid F \sqsubseteq G \wedge \overline{\Delta}(G) \sqsubseteq G \wedge G \in F\mathbb{P}(U) \right\}$$

hence by definition of Inf it is sufficient to prove

$$(2) \quad \forall G \left( G \in F\mathbb{P}(U) \wedge F \sqsubseteq G \wedge \overline{\Delta}(G) \sqsubseteq G \rightarrow \overline{\Delta}(F)(y) \leq G(y) \right)$$

From  $F \sqsubseteq G$  by monotonicity of  $\overline{\Delta}$  (lemma 20) we get  $\overline{\Delta}(F) \sqsubseteq \overline{\Delta}(G)$ , hence by  $\overline{\Delta}(G) \sqsubseteq G$  we obtain  $\overline{\Delta}(F) \sqsubseteq G$ , i. e.  $\overline{\Delta}(F)(y) \leq G(y)$  for every  $y \in U$ .

Now, by using  $\Psi$  we construct a set  $\Delta_\Psi$  of fuzzy deduction rules as follows. Therefore we fix an  $n \in \mathbb{N}$ . and an  $\mathfrak{x} \in U^n$ . Let  $\text{SET}_\mathfrak{x}$  be the set of elements of  $U$  belonging to  $\mathfrak{x}$ . For and arbitrary  $y \in U$  and  $F \in F\mathbb{P}(U)$  we define

$$F_\mathfrak{x}(y) =_{\text{def}} \begin{cases} F(y) & \text{if } y \in \text{SET}_\mathfrak{x} \\ 0 & \text{if } y \notin \text{SET}_\mathfrak{x} . \end{cases}$$

Hence  $F_\mathfrak{x}$  is finite and  $F_\mathfrak{x} \sqsubseteq F$ . Furthermore  $\text{supp}(F_\mathfrak{x}) = \text{SET}_\mathfrak{x}$ . ■

**Definition 14**

1.  $\delta_\Psi^{n,F}(\mathfrak{x}, y) =_{\text{def}} \Psi(F_\mathfrak{x})(y)$  where  $\mathfrak{x} \in U^n$  and  $y \in U$
2.  $\Delta_\Psi =_{\text{def}} \left\{ \delta_\Psi^{n,F} \mid n \in \mathbb{N} \wedge F \in F\mathbb{P}(U) \right\}$

**Lemma 28**

If  $\Psi$  is compact then

$$\forall F \left( F \in F\mathbb{P}(U) \rightarrow \Psi(F) \sqsubseteq \Psi_{\Delta_\Psi}(F) \right) .$$

**Proof**

We have to prove that for every  $y \in U$  and  $F \in F\mathbb{P}(U)$ ,

$$(1) \quad \Psi(F)(y) \leq \Psi_{\Delta_\Psi}(F)(y) .$$

By compactness of  $\Psi$  we have

$$(2) \quad \exists F_{fin} \left( F_{fin} \in F\mathbb{P}(U) \wedge F_{fin} \text{ is finite} \wedge F_{fin} \sqsubseteq F \wedge \Psi(F)(y) \leq \Psi(F_{fin})(y) \right)$$

Assume  $\text{card } \text{supp}(F_{fin}) = n$ . We define

$$\delta_\Psi^{n,F_{fin}}(\mathfrak{x}, y) =_{\text{def}} \Psi \left( (F_{fin})_\mathfrak{x} \right)(y) .$$

Then we get for  $\mathfrak{x}_0 = \{x_1, \dots, x_n\} = \text{supp}(F_{fin})$

$$(3) \quad \begin{aligned} & \Psi(F_{fin})(y) \\ &= \Psi \left( (F_{fin})_{\mathfrak{x}_0} \right)(y) \\ &= \delta_\Psi^{n,F_{fin}}(\mathfrak{x}_0)(y) \\ &\leq \text{Sup} \left\{ \delta_\Psi^{n,F_{fin}}(\mathfrak{x})(y) \mid \mathfrak{x} \in U^n \right\} \\ &= \overline{\delta_\Psi^{n,F_{fin}}}(F_{fin})(y) \\ &\leq \overline{\Delta_\Psi}(F_{fin})(y) \\ &\leq \overline{\Delta_\Psi}(F)(y) \quad \text{by lemma 20} \\ &\leq \Psi_{\Delta_{Psi}}(F)(y) \quad \text{by lemma 27} \end{aligned}$$

Thus, lemma 28 holds. ■

For proving the following lemma 29 we need the concept of strong submodality of an operator  $\Psi$ .

**Definition 15**

$\Psi$  is said to be strongly submodal on  $U$

$\stackrel{\text{def}}{=}$

For every  $y \in U, F \in F\mathbb{P}(U)$  there exist  $n^0 \in \mathbb{N}, x_1^0, \dots, x_n^0 \in U$  such that

$$\begin{aligned} & \text{Sup} \left\{ \min \left( \Psi(F)(x_1), \dots, \Psi(F)(x_n), \Psi(H_{[x_1, \dots, x_n]})(y) \right) \right\} \\ & \quad n \in \mathbb{N} \wedge H \in F\mathbb{P}(U) \wedge x_1, \dots, x_n \in U \\ & = \min \left( \Psi(F)(x_1^0), \dots, \Psi(F)(x_n^0), \Psi \left( \Psi(F)_{[x_1^0, \dots, x_n^0]} \right)(y) \right) \end{aligned}$$

**Lemma 29**

If  $\Psi$  is a closure operator on  $L$  and  $\Psi$  is strongly submodal,

then

$$\forall F (F \in F\mathbb{P}(U) \rightarrow \Psi_{\Delta\Psi} \sqsubseteq \Psi(F)) .$$

**Proof**

For every  $y \in U$  and every  $F \in F\mathbb{P}(U)$  we have to prove

$$(1) \quad \Psi_{\Delta\Psi}(F)(y) \leq \Psi(F)(y) .$$

By definition of  $\Psi_{\Delta\Psi}$  we have

$$(2) \quad \Psi_{\Delta\Psi}(F)(y) = \text{Inf} \{ G(y) \mid F \sqsubseteq G \wedge \overline{\Delta\Psi}(G) \sqsubseteq G \},$$

hence

$$(3) \quad \forall G (F \sqsubseteq G \wedge \overline{\Delta\Psi}(G) \sqsubseteq G \rightarrow \Psi_{\Delta\Psi}(F)(y) \leq G(y)) .$$

Put

$$(4) \quad G \stackrel{\text{def}}{=} \Psi(F)$$

Hence it is sufficient to prove

$$(5) \quad F \sqsubseteq \Psi(F)$$

and

$$(6) \quad \overline{\Delta\Psi}(\Psi(F)) \sqsubseteq \Psi(F) .$$

The condition (5) holds trivially because  $\Psi$  is embedding.

Now, we are going to show (6), i. e. we have to prove

$$(7) \quad \forall y (y \in U \rightarrow \overline{\Delta\Psi}(\Psi(F))(y) \leq \Psi(F)(y))$$

By definition of  $\overline{\Delta\Psi}$  we have

$$(8) \quad \overline{\Delta\Psi}(\Psi(F))(y) = \text{Sup} \left\{ \min \left( \Psi(F)(x_1), \dots, \Psi(F)(x_n), \delta_{\Psi}^{n,H}(x_1, \dots, x_n, y) \right) \right\} \\ \quad n \in \mathbb{N} \wedge H \in F\mathbb{P}(U) \wedge x_1, \dots, x_n \in U$$

Now, by definition of  $\delta_{\Psi}^{n,H}$  we have

$$(9) \quad \delta_{\Psi}^{n,H}(\mathfrak{x}, y) =_{\text{def}} \Psi(H_{\mathfrak{x}})(y) \quad \text{where } \mathfrak{x} \in U^n \text{ and } y \in U$$

hence from (8),

$$(10) \quad \overline{\Delta_{\Psi}}(\Psi(F))(y) = \text{Sup} \left\{ \min(\Psi(F)(x_1), \dots, \Psi(F)(x_n), \Psi(H_{\mathfrak{x}})(y)) \mid n \in \mathbb{N} \wedge H \in F\mathbb{P}(U) \wedge \mathfrak{x} \in U^n \wedge \mathfrak{x} = [x_1, \dots, x_n] \right\}$$

Hence, because  $\Psi$  is strongly submodal, there are  $n^0, x_1^0, \dots, x_{n^0}^0 \in U$  such that

$$(11) \quad \overline{\Delta_{\Psi}}(\Psi(F))(y) = \min \left( \Psi(F)(x_1^0), \dots, \Psi(F)(x_{n^0}^0), \Psi \left( \Psi(F)_{[x_1^0, \dots, x_{n^0}^0]} \right)(y) \right).$$

Now, we have

$$(12) \quad \Psi(F)_{[x_1^0, \dots, x_{n^0}^0]} \sqsubseteq \Psi(F)$$

hence by monotonicity of  $\Psi$

$$(13) \quad \Psi \left( \Psi(F)_{[x_1^0, \dots, x_{n^0}^0]} \right) \sqsubseteq \Psi(\Psi(F)),$$

hence by closedness of  $\Psi$

$$(14) \quad \Psi \left( \Psi(F)_{[x_1^0, \dots, x_{n^0}^0]} \right) \sqsubseteq \Psi(F),$$

hence by 11 we get

$$(15) \quad \overline{\Delta_{\Psi}}(\Psi(F))(y) \leq \Psi(F)(y)$$

for every  $y \in U$ .

Thus, (6) holds, i. e. lemma 29 is proved. ■

### Theorem 30

*If  $\Psi$  is a strongly submodal compact closure operator, then*

$$\forall F (F \in F\mathbb{P}(U) \rightarrow \Psi(F) = \Psi_{\Delta_{\Psi}}(F))$$

### Proof

By lemma 28 and lemma 29. ■

## 5 Concluding Remarks

Because of restricted space in chapter 4 we could not develop a fuzzification of the whole theorems 16, 17, 18, and 19. In a forthcoming paper we shall continue the investigations started in the paper presented.

### Acknowledgement

The author likes to thank Radko Mesiar for fruitful scientific discussions and Mario Thalheim for his help in preparing the manuscript.
