

# Acknowledgments

As I worked at National Lien-Ho Technology Institute, the administrator permitted me to study at Dortmund University in Germany; therefore I had the opportunity to write this thesis. As we know, a thesis, which can be finished, normally needs to be supported by many people.

Therefore I want to express my gratitude to my advising Professor, Prof. Dr. Dr. Stefan Kulig first, for his instruction, encouragement and the opportunity to work with him at Dortmund University. His positive and earnest attitude to solve problems is the best demonstration for my own motivation.

I also thank Prof. Dr.-Ing. E. Handschin for his kindly survey and the fruitful discussions, which have been an enhancement for this thesis.

I thank the chairman of the Electrical Engineering Department, Prof. Hsuang-Chang Chiang for his administrative help and for the possibility to study in Germany. I'd also like to thank Prof. Yu-Chi Wu and Dr. Fu-Jue Chang for their help to support the research equipment in Taiwan.

I express my thanks to my wife, Mei-Hua Liu, for accompanying me during my study in Germany.

I thank my parents, for their support to finish this thesis.

Finally I thank the chair of Electrical Drives and Mechatronics at Dortmund University for daily help.
